Housebound Module for HBC

The Housebound module is an addition to Koha to allow the library to link together housebound patrons, volunteers, delivers and book choosers. At this point there is no complicated functionality, the feature is there to pull together information (that is currently in MS Access) into one place and be able to report on it.

Later, there could be the possibility of enhancing this further by making some intelligent book choices for patrons (like a recommender service).

There will be a new Koha database table, called "housebound" which is described as follows :-

Field	Туре	Null	Кеу	Default	Value Description
hbnumber	int(11)	NO	PRI	NULL	auto_increment db key
day	text	NO		NULL	A dropdown list of weekdays (Monday – Friday)
dmy	date	YES		NULL	This will come from an authorised value, the policies being created by library staff. The dates are on a known rota and will be chosen from a list
time	text	YES		NULL	am or pm (is good enough)
frequency	text	YES		NULL	This will come from an authorised value, the policies being created by library staff. There will be values such as "weeks 1/3, weeks 2/4, week 1, week 3).
borrowernumber	int(11)	YES	MUL	NULL	Links the hb record to the borrower record
volunteer	int(11)	YES	MUL	NULL	Links the hb record to a volunteer record which will keep the name, address, etc. of the volunteer.
chooser	int(11)	YES	MUL	NULL	Links the hb record to a chooser record which will keep the

					name, address, etc. of the person who picks the books for the patron.
deliverer	int(11)	YES	MUL	NULL	Links the hb record to a deliverer record which will keep the name, address, etc. of the person who delivers the books for the patron.
hours	int(11)	YES		NULL	Number of hours worked / week (this is simply a value for information purposes so that the library know how many hours they are getting from volunteers). May need to be reported against.
ltype_quant	varchar(10)	YES		NULL	This can have one or more values which will be picked from list of loanable itypes (with a checkbox alongside each). For example you might have 2 BKS, 1 DVD etc.
Item_subject	text	YES		NULL	Not sure whether this is free text or coming from collection codes just yet.
Item_authors	text	YES		NULL	One or more values. Free text.
referral	text	YES		NULL	Free text. The person or organisation who referred this patron.
notes	text	YES		NULL	Things like "Beware of the dog!"

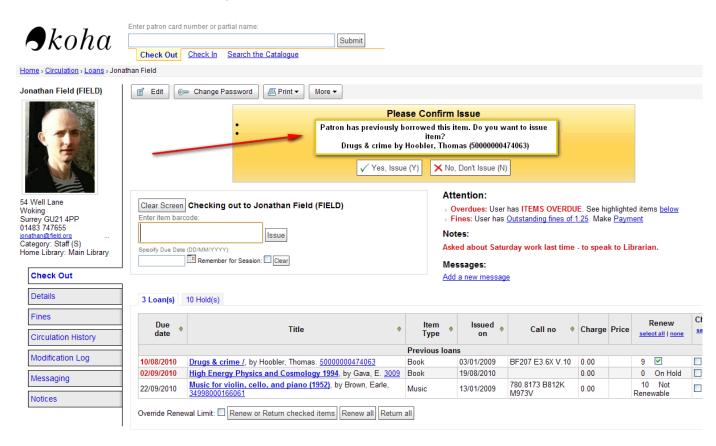

Halton may want to store the "HDS Number" (used currently). It was agreed this would be stored as a patron authorised value on the borrower record if required.

The screen will look something like this:-

Checkout

At checkout Koha will see if the item being borrowed is, a) already on loan or b) part of the loan history. If so, a warning dialogue will be displayed. The checkout wizard will make this comparison based on the Koha biblionumber.

New System Preferences:

Housebound ON/OFF (use the Housebound module, enables the Housebound tab on the patron record)

Previous Issue ON/OFF (If on, checks the issues and old_issues table by the biblionumber). You will be able to decide which patron categories have this feature switched on (so that you may want it for housebound but no one else). It was also felt that this could be set as a patron permission (check for previous issue) in which case you apply it patron by patron.

Pre-requisites:-

There will need to be a patron category called "HB (Housebound)".

There will need to be a patron category called "VOL (Volunteer)".

There will need to be a patron category called "CHO (Chooser)".

There will need to be a patron category called "DELIV (Deliverer)".
